

ROTARY CAPPER MACHINERY AUDIT PROGRAM

Maximize Performance & Operating Efficiency

- Scheduled expert service delivers maximum productivity
- Improve efficiency and operational performance
- Prevent machine downtime
- Maximize the return of your investment

Precision Engineered Equipment

Pacific's Machinery Audit Program

Pacific's Machinery Audit Program was developed to support our customers by maximizing their overall production performance. The program will keep your Pacific rotary cappers and Pack West cap handling equipment running smoothly and fully optimized.

Pacific's Machinery Audit Program is an effective preventative maintenance option developed to increase your machines efficiency, application performance and overall asset utilization.

The Machinery Audit Program is performed on-site in one to two days depending on the number of cappers. Pacific Packaging Machinery technicians conduct a complete inspection of:

- the main drive
- capping zone
- spindle shaft assemblies
- closure delivery systems
- capping headsets and chucks
- bottle controls
- electrical components

Following the inspection and analysis, a detailed written summary is provided to document the current condition of your system, complete with recommended action steps to improve your machine's overall performance.

Capping machines require periodic maintenance and rebuilding to deliver maximum application performance. In addition to the Machine Audit Program, Pacific offers an onsite rebuild of your rotary capping machines. We schedule this service in conjunction with your customer preventive maintenance schedule, keeping downtime to a minimum.
